

draft-penno-alto-cdn

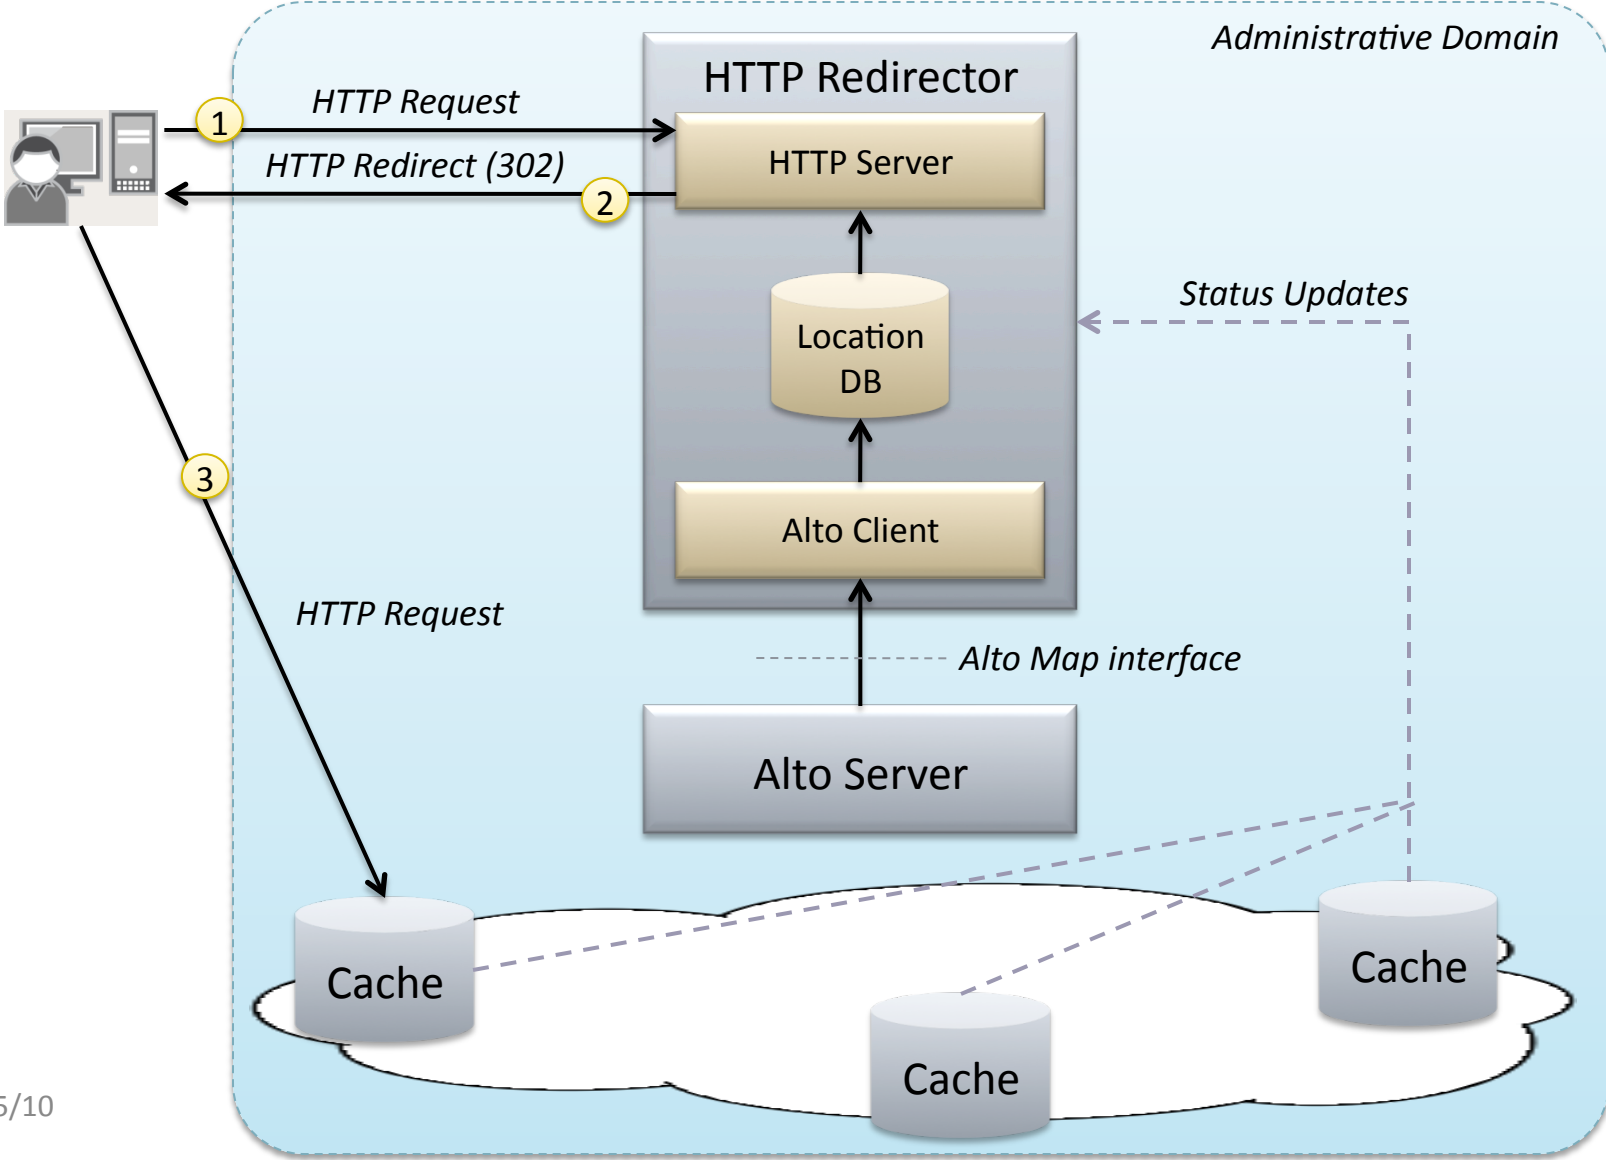

Alto Server and the CDN

- Goal:
 - Optimize traffic inside CDN
 - Improve global and local server load balancing
 - Facilitate topology & status information sharing between domains (e.g. CDN – ISP)

Alto Protocol Gaps

- **PID Attributes:** In order to disambiguate between PIDs that contain endpoints of a specific class, a PID property is needed. A PID can be classified as containing "CDN nodes", "Mobile Hosts", "Wireline Hosts", etc.
- **PID Attributes and Query:** PID attributes can be used by the Client to select an appropriate host and also passed as a constraint in the map filtering service.
- **Default Cost:** The issue of default cost is one of importance. Without a default PID with endpoint '0.0.0.0/0', what should be the cost between two PIDs? Moreover, if the default PID is mandatory in the protocol?
- **Push Mechanism:** It is important for the ALTO Service through the ALTO protocol or a companion protocol to provide a push mechanism from server to client. The push mechanism can be a notification that new data is available or the data itself.
- **Incremental Map Updates:** A natural evolution to the protocol if maps are large and change often is to allow for incremental map updates. In this sense the map contained in the reply would be considered the delta from the previous version.
- There is a need to define how ALTO servers may communicate with each other in a federated model [SR: Is this any different from the network map and cost map queries? Is the ALTO server expected to check if the requester is in its own network?].
- **ALTO Border Router PID attribute:** In order for administrative domains to collate costs across domain boundaries, the border routers may be placed in their own PIDs. Such PIDs may be identified by a Border Router attribute.
